

HOST MODULATION THERAPY SCRIPT

Emerging research information is linking gum disease to more serious health problems like heart disease. Thus, we are taking the subtle signs of gum disease, like we are now seeing in your mouth, more seriously.

We have always known that bacteria causes gum disease. But, what causes the bone loss around teeth is the release of certain enzymes (inflammatory mediators) by your gum cells in response to the bacteria. When your gums are inflamed these enzymes can get into your blood stream and have effects elsewhere in the body. Thus, it has become extremely important to eliminate any ongoing gum inflammation.

We now have a way to block the release of these harmful enzymes and it is as easy as taking a pill twice a day. You take the medication over a long period of time (3-9 months). This approach, along with a solid effort aimed at eliminating the bacteria above and below the gum line, will give you the best chance to completely eliminate inflammation in your mouth. Because of the link with other health problems it is important to do whatever it takes to eliminate inflammation in your mouth.

Here's more information and the prescription. Get it filled and take it as directed.

Following our treatment plan will certainly delay, minimize and maybe even eliminate the need for more advanced treatment down the road.

Taking the medication is necessary for a good outcome in your case and getting a good outcome is probably more important than we first thought (in light of the links between gum inflammation and other health problems).
